Skyglow Model 2012

All-Sky Average Light Pollution Ratio
Night Sky Metrics LLC

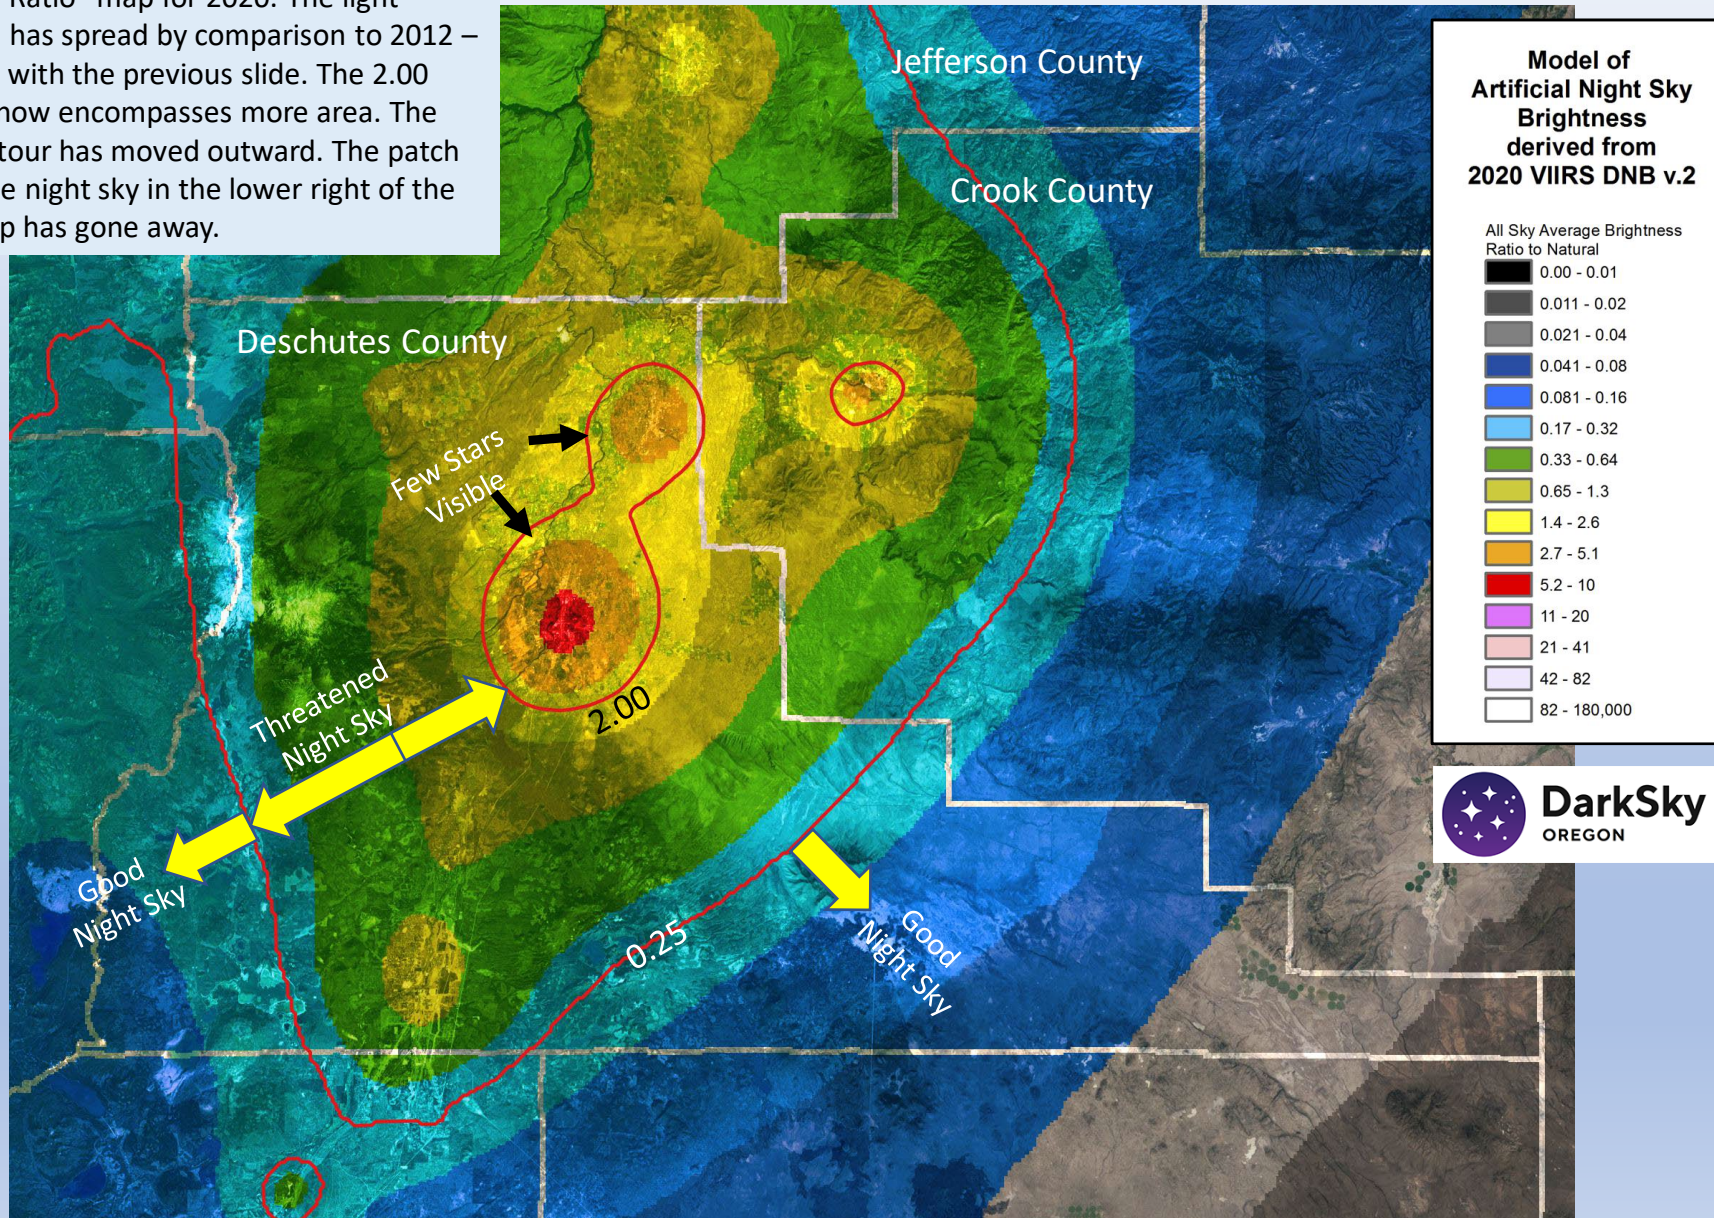

Notes: This is the "All-Sky Average Light Pollution Ratio" map for 2012. The colors and contours represent the ratio between a light polluted and pristine night sky. Ratio values higher than 2.0 identify areas where few stars are visible. Ratio values lower than 0.25 are considered good, starry night sky. In between those two contours, the night sky is considered threatened or compromised.

Skyglow Model 2020

All-Sky Average Light Pollution Ratio
Night Sky Metrics LLC

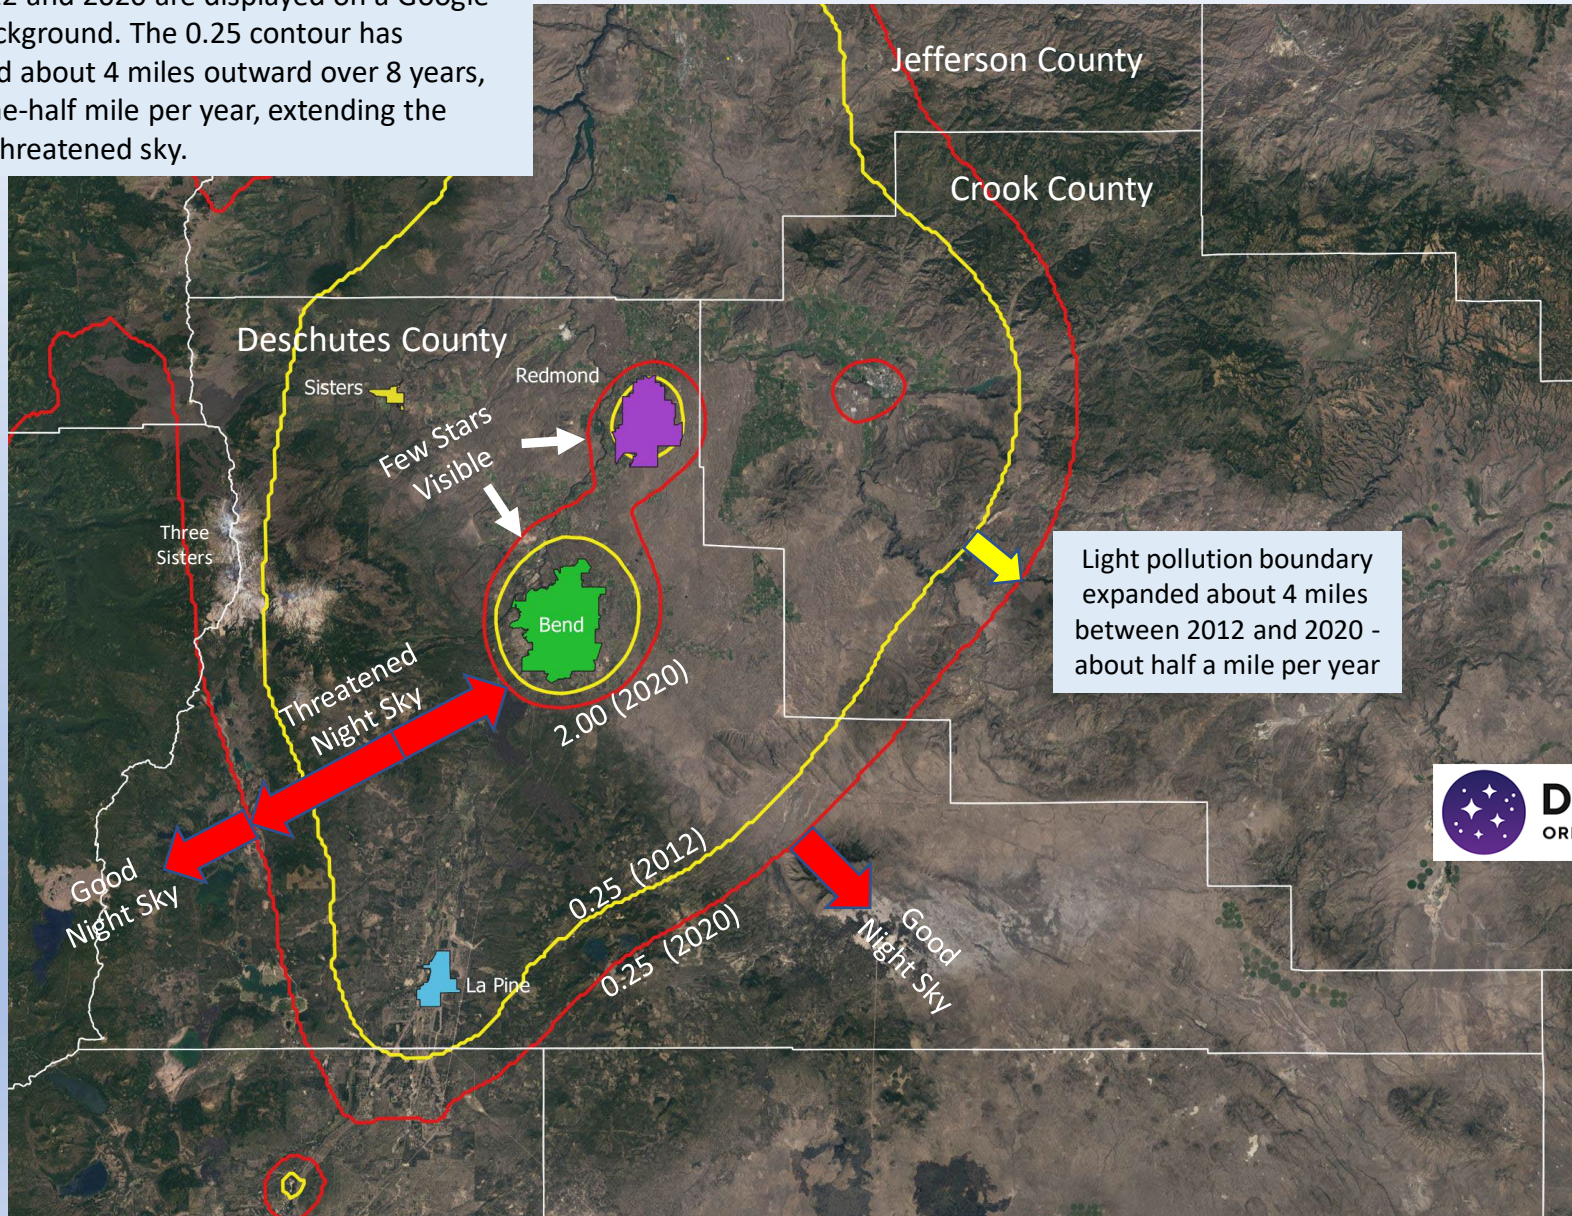

Notes: This is the "All-Sky Average Light Pollution Ratio" map for 2020. The light pollution has spread by comparison to 2012 – compare with the previous slide. The 2.00 contour now encompasses more area. The 0.25 contour has moved outward. The patch of pristine night sky in the lower right of the 2012 map has gone away.

Compare 2012 and 2020 Models

All-Sky Average Light Pollution Ratio
Night Sky Metrics LLC

Notes: The light pollution ratio contours from both 2012 and 2020 are displayed on a Google Earth background. The 0.25 contour has expanded about 4 miles outward over 8 years, about one-half mile per year, extending the zone of threatened sky.

The skyglow calculations are conservative – the reality is worse because:

Reality #1 Satellite doesn't see the blue in the spectrum of white lights

- Many lights such as white LEDs emit a significant amount of blue light in their spectrum
- Blue light scatters more than green, yellow and red parts of the visible spectrum
- However, the satellite does not see the blue visible light from each lamp

Reality #2 Satellite pixels are large and may not pick up sparse lights

- There are many widely separated lights in rural areas which contribute to skyglow
- The satellite looks with large pixels – about 500 meters x 500 meters
- The satellite may not be sensitive enough to see the widely separated lights

Reality #3 Satellite images exclude cloudy nights, but clouds multiply the skyglow

- Cloudy nights are excluded from the satellite images
- Clouds reflect back downward the artificial light at night coming up from the ground
- Glow downward from clouds is 10x or more brighter than skyglow during clear nights

These Skyglow Models -

Are based on

- All-Sky light pollution - not just at the zenith, but entire hemisphere, down to horizon
- Cloud-free night time satellite images from NASA's VIIRS Sensor
- Model of light scattering by the atmosphere
- Atmosphere characteristic of Western US desert areas
- Distance to light sources calculated via Geographic Information System
- No topographic blocking or highlighting
- Calibration by National Park Service measurements of hemispheric sky luminance and zenith sky luminance measurements

$$\text{ALR} = \frac{\text{Sky Luminance} - \text{Pristine Sky Luminance}}{\text{Pristine Sky Luminance}}$$

$$\text{ALR} = \frac{\text{Sky Luminance} - 250 \text{ micro Candelas/meter squared}}{250 \text{ micro Candelas/meter squared}}$$

The method is described in this publication: "A simplified model of all-sky artificial sky glow derived from VIIRS Day/Night band data", 2018.

How can we minimize light pollution? -- Adopt the Five Principles for Responsible Outdoor Lighting

LIGHT TO PROTECT THE NIGHT

Five Principles for Responsible Outdoor Lighting

Illuminating
ENGINEERING SOCIETY

USEFUL

ALL LIGHT SHOULD HAVE A CLEAR PURPOSE

Before installing or replacing a light, determine if light is needed. Consider how the use of light will impact the area, including wildlife and the environment. Consider using reflective paints or self-luminous markers for signs, curbs, and steps to reduce the need for permanently installed outdoor lighting.

TARGETED

LIGHT SHOULD BE DIRECTED ONLY TO WHERE NEEDED

Use shielding and careful aiming to target the direction of the light beam so that it points downward and does not spill beyond where it is needed.

LOW LIGHT LEVELS

LIGHT SHOULD BE NO BRIGHTER THAN NECESSARY

Use the lowest light level required. Be mindful of surface conditions as some surfaces may reflect more light into the night sky than intended.

CONTROLLED

LIGHT SHOULD BE USED ONLY WHEN IT IS USEFUL

Use controls such as timers or motion detectors to ensure that light is available when it is needed, dimmed when possible, and turned off when not needed.

COLOR

USE WARMER COLOR LIGHTS WHERE POSSIBLE

Limit the amount of shorter wavelength (blue-violet) light to the least amount needed.

Notes: These five principles are the cornerstone of responsible outdoor lighting. They emphasize outdoor lighting for safety and quality of life – by preventing light trespass, by eliminating over-lighting which produces sharp dark shadows and glare, by encouraging smart lighting and warm colored light which is more beneficial to the ecosystem than blue-rich white light. Deschutes County can improve night time safety and quality of life by adopting these principles.
